Assignment 13 Solutions

1. Write a program that calculates and prints the value according to the given formula:

```
Q = Square root of [(2 * C * D)/H]
Following are the fixed values of C and H:
C is 50. H is 30.
```

D is the variable whose values should be input to your program in a comma-separated sequence.

Example: Let us assume the following comma separated input sequence is given to the

program: 100,150,180

The output of the program should be: 18,22,24

In [1]:

```
from math import sqrt
 1
   def calculateProgram():
        in_num = eval(input("Enter the Input: "))
 3
 4
       out num = []
 5
       C = 50 # Declaring and initializing constant C
       H = 30 # Declaring and initializing constant H
 6
 7
       for ele in in_num:
            Q = str(int(sqrt((2*C*ele)/H)))
 8
9
            out_num.append(Q)
10
        print("Output: {}".format(','.join(out_num)))
11
12
   calculateProgram()
```

Enter the Input: 100,150,180

Output: 18,22,24

2.Write a program which takes 2 digits, X,Y as input and generates a 2-dimensional array. The element value in the i-th row and j-th column of the array should be i*j.

```
Note: i=0,1..., X-1; j=0,1, iY-1. Example: Suppose the following inputs are given to the program: 3,5 Then, the output of the program should be: [[0, 0, 0, 0], [0, 1, 2, 3, 4], [0, 2, 4, 6, 8]]
```

In [2]:

```
def createMatrix(n,m):
 2
 3
        M = []
 4
        print("Enter the element :")
 5
        for i in range(n):
 6
            #stor row
 7
            row =[]
 8
            for j in range(m):
9
                row.append(i*j)
10
            M.append(row)
11
        return(M)
12
13 x = int(input("Enter x : "))
14 y = int(input("enter y : "))
   createMatrix(x,y)
```

```
Enter x : 3
enter y : 5
Enter the element :

Out[2]:
[[0, 0, 0, 0, 0], [0, 1, 2, 3, 4], [0, 2, 4, 6, 8]]
```

3. Write a program that accepts a comma separated sequence of words as input and prints the words in a comma-separated sequence after sorting them alphabetically?

Suppose the following input is supplied to the program: without, hello, bag, world Then, the output should be: bag, hello, without, world

In [4]:

```
def sortString():
    in_string = input('Enter comma seperated words: ')
    out_string = ','.join(sorted(in_string.split(',')))
    print(f'Output: {out_string}')
    sortString()
```

Enter comma seperated words: without,hello,bag,world
Output: bag,hello,without,world

4. Write a program that accepts a sequence of whitespace separated words as input and prints the words after removing all duplicate words and sorting them alphanumerically.

Suppose the following input is supplied to the program: hello world and practice makes perfect and hello world again

Then, the output should be: again and hello makes perfect practice world

In [5]:

```
def sortAlphaNumerically():
    in_string = input("Enter the Input String: ")
    out_string = ' '.join(sorted(sorted(list(set(in_string.split(" ")))))
    print(f'Output: {out_string}')
    sortAlphaNumerically()
```

Enter the Input String: hello world and practice makes perfect and hello world again
Output: again and hello makes perfect practice world

5. Write a program that accepts a sentence and calculate the number of letters and digits.

```
Suppose the following input is supplied to the program: hello world! 123
Then, the output should be:
LETTERS 10
DIGITS 3
```

In [8]:

```
s = input("Input a string : ")
   digits=letters=0
   for c in s:
4
       if c.isdigit():
 5
            digits += 1
 6
       elif c.isalpha():
7
            letters += 1
8
       else:
9
            pass
10 print("Letters", letters)
   print("Digits", digits)
```

Input a string : hello world! 123
Letters 10
Digits 3

6.A website requires the users to input username and password to register. Write a program to check the validity of password input by users.

Following are the criteria for checking the password:

- 1. At least 1 letter between [a-z]
- 2. At least 1 number between [0-9]
- 3. At least 1 letter between [A-Z]
- 4. At least 1 character from [\$#@]
- 5. Minimum length of transaction password: 6
- 6. Maximum length of transaction password: 12

Your program should accept a sequence of comma separated passwords and will check them according to the above criteria. Passwords that match the criteria are to be printed, each separated by a comma.

Example:

If the following passwords are given as input to the program: ABd1234@1, a F1#, 2w3E*, 2We3345 Then, the output of the program should be: ABd1234@1

In [10]:

```
def checkPassword():
 1
        in_string = input("Enter the passwords are given as to the program: ")
 2
 3
        small list = "abcdefghijklmnopgrstuvwxyz"
 4
        cap list = "ABCDEFGHIJKLMNOPQRSTUVWXYZ"
        num_list = "0123456789"
 5
 6
        special_list = "$#@"
 7
        for ele in in_string.split(","):
            if len(ele) <= 12 and len(ele) >=6 :
 8
 9
                if any(i.isupper() for i in ele):
                    if any(i.islower() for i in ele):
10
11
                        if any(i for i in ele if i in special_list):
12
                             print(ele)
13
   checkPassword()
```

Enter the passwords are given as to the program: ABd1234@1,a F1#,2w3E*,2We33 45 ABd1234@1

In []:

```
1
```
